Straight up installation

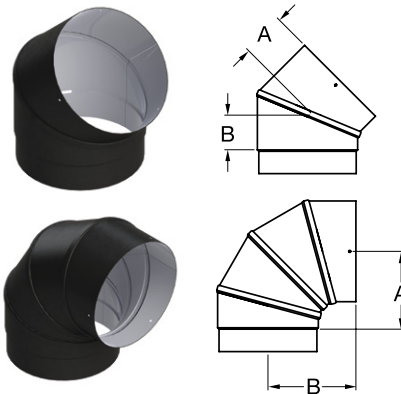

For most straight up installations, the only part required is an adjustable length (SWA). The SWA adjusts to allow any overall length form 40" to 68".

90° elbow installation

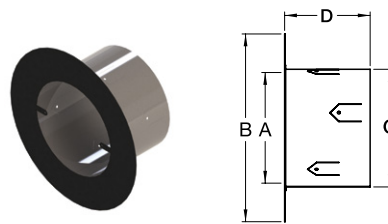

For most 90° elbow installations, you will only require an elbow (SW90 and an adjustable length SWA). If the height from the top of the stove to the top of the elbow is less than 48", you will require a short length plus a slip section (SW1S) for the vertical section of the connector instead of the SWA.

*All adjustable elbows require tolerance to permit them the turn. This can infrequently allow a small amount of water leakage. Fixed elbows have a smaller radius and are drip free.
